

## Project 3 Self Evaluation

Aiden Zelakiewicz

For Project 3 our team worked very well together, and the workload was much more evenly distributed than previous projects. One member did the bulk work of the code, doing the original calculations and computations. The rest of us just made corrections to the code, making sure the values were correct and fixing them if not. The same group member wrote parts of the paper which corresponded to the code they understood most which was very useful. Myself and the other group member wrote the rest of the paper, created the presentation and presented. The workload was much more manageable for this project than the previous ones because of the even distribution of work.

I believe for this project I shared a much more even workload with the rest of the group members. I relied on the base code production to Justin, only making corrections where poor values or slight mistakes occurred. This was a much more supportive role in the code than I have taken on in previous projects. In this project I lead the paper, while also taking a support role on the presentation. For the next project I actually would like to keep the same workload if possible. It was a very balanced amount of work for all group members.
